US Citizen in San Diego, CA

Education & Certificates

- B.S. in Mathematics-Computer Science – UCSD — Expected June 2027 (GPA 3.8)
- A.S. in Mathematics – Moorpark College — Graduated

Work History

Tutor at Moorpark College — *January 2024 to June 2025*

- Collaborated with a team of tutors to coordinate lesson plans across Python, C++, and Java, so students got consistent, high-quality help no matter which tutor they saw.
- Met weekly with managers to get direction and criticism so I could adapt my teaching styles to students with different technical backgrounds.
- Taught students in both STEM and non-Stem majors, ensuring that they could understand difficult concepts.

Projects

EmailAssist — *June 2027 to Current*

- Used JavaScript, HTML, CSS, to build a front-end email application that organized emails for users to easily manage their cluttered inboxes.
- Built a backend using Python, and object-oriented programming (OOP) that classifies emails using a configurable AI, so users could make categories and define each one's importance.
- Integrated RESTful APIs (Gmail API) into an event driven workflow, enabling users to read, send, delete, and classify their emails without ever leaving the app.
- Designed a SQL database to store configurations and emails and their metadata, allowing users to tweak their LLM, and retrieve their classifications.

Batch Photo Processor — *February 2027 to Current*

- Designed an object-oriented programming (OOP) C++ terminal application, so users could edit across an entire photo album in one action instead of adjusting images one by one.
- Used Git and agile development practices to collaborate with two other engineers, reviewing each other's code and incorporating feedback to catch bugs early and keep the codebase reliable.
- Implemented a SQL database to store and organize photo metadata, so users could instantly see which albums still needed edits instead of manually digging through folders.
